                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175 and the encoded proteins (ABB27137-ABB72072). The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pt_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            10;

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher enkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ę,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           429

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to the isolation of novel human neoplastic disease associated polypeptides, and cDNA (AAS34767-AAS35050) and DNA sequences encoding for these polypeptides. The sequences of the invention sequences incoding for these polypeptides. The sequences of the invention disorders involving neoplastic disease such as hyperproliferative disorders involving neoplastic disease such as hyperproliferative disorders (e.g. leukaemia, bone cancer, bladder cancer, brain stem clioma, adult liver cancer, childhood cerebellar astrocytoma, or hodgkin's lymphoma). The sequences of the invention may also be useful for treating other disorders, reproductive disorders, jamune system disorders, reproductive disorders, gastrointesinal disorders, pulmonary disorders, reproductive disorders and renal disorders. The polymucleotide sequences of the invention are also useful in gene therapy. AA011568-AA012851 represent the novel human neoplastic disease associated polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was contained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   75 KRVVD-----NLQORLG------INYLD-----EFDEFOKEYENALIDYPKKVDG 113

The invention relates to novel isolated nucleic acid molecules (I)
encoding human secreted DNA repair and processing proteins (II). (I) and
concing human secreted DNA repair and processing proteins (II). (I) and (II) may be used in the prevention, treatment and
diagnosis of diseases associated with inappropriate expression of (II),
concerned of (II) may be used to treat disorders associated with
decreased expression of (II) by rectifying mutations or deletions in a
concerned may also be used as DNA probes in diagnostic assays (e.g.
concerned may also be used as DNA probes in diagnostic assays (e.g.
polymerase chain reactions (PCR) to detect and quantitate the presence
concerned may also be used as antigens in the production
concerned in samples, and so which patients may be in need of
restorative therapy. (II) may also be used as antigens in the production
concernibodies and in assays to identify modulators (agonists and
contibodies and in assays to identify modulators (agonists and
antibodies and in assays to identify modulators (agonists and
control of the expression and activity of (II). The anti-(II)
antibodies and antagonists may also be used to down regulate expression
and activity of (II). The anti-(II) antibodies may also be used as
concerned and antagonists may also be used to down regulate expression
and activity of (II). The anti-(II) antibodies may also be used to
disorders include e.g. immune/autoimmune diseases (e.g. human
confunctioned in the presence of (II) in samples. The
immunodeficiency virus (HIV), infections, anaemia, rheumatoid arthritis
confunctioned and thrombosial diseases (e.g. Alzheimer's disease and
confunctioned and thrombosis), infections caused by bacteria, viruses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               75 KRVVD-----NLOORLG------INYLD-----EFDEFOKEYENALIDYPKKVDG 113

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 29,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                                                                                                                                                                                                           Sequence 64, Application US/09813329

Patent No. US20020012968A1

GENERAL INFORMATION:

APPLICANT: Bristol-Myers Suibb Company

TITLE OF INVENTION: No. US20020012968A1el Drosophila Tumor Necrosis Factor Class Mole

TITLE OF INVENTION: Variants Thereof

FILE REFERENCE: D0016.np

CURRENT APPLICATION VMBER: US/09/813,329

CURRENT APPLICATION NUMBER: 60/190,816

PRIOR APPLICATION NUMBER: 60/190,816

PRIOR FILING DATE: 2000-03-21

NUMBER OF SEQ ID NOS: 65

SOFTWARE: Patentin version 3.0

SEQ ID NO 64
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            APPLICANT: Wu, Wei APPLICANT: Wu, Wei APPLICANT: Boukharov, Andrey A. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

IPHI protein - yeast (Saccharomyces cerevisiae)

NyAlternate names: protein L8083.9; protein YR223c; RRP3 protein
C;Species: Saccharomyces cerevisiae
C;Date: 10-oct-1995 #sequence revision 03-Nov-1995 #text_change 21-Jul-2000
C;Accesion: S55352, 551446; 547477
R;Cherel, I.; Thuriaux, P.
Yeast II, 261-270, 1995
A;Title: The IFHI gene product interacts with a fork head protein in Saccharomyces cerev
A;Reference number: S55352, MUID:95304839; PMID:7785326

-!- FUNCTION: May play a role in the regulation of calcium sequestration or release in the SR of skeletal and cardiac muscle.
-!- SUBCELLULAR LOCATION: Sarcoplasmic reticulum lumen.
-!- SIMILARITY: STRONG, TO RABBIT HRC.
                                                                                                                                     Gaps

-! FWOTION: Probably involved in epithelial-mesenchymal signaling. Isoform Al binds only to the receptor EDAR, while isoform A2 binds exclusively to the receptor XEDAR (By similarity).

-! SUBGELGUIAR LOCATION: Type II membrane protein and secreted (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                -!- PTM: N-glycosylated (By similarity).
-!- PTM: N-glycosylated (By similarity).
-!- PTM: Processing by furin produces a secreted form (By similarity).
-!- DISBABE: Defects in EDI are the cause of anhidrotic ectodermal dysplasia. The disease is characterized by sparse hair (atrichosis or hypotrichosis), abnormal or missing teeth and the inability to sweat due to the absence of sweat glands.
-!- SIMILARITY: Belongs to the tumor necrosis factor family.
-!- SIMILARITY: Contains 1 collagenous domain.

PTM: N-glycosylated.

PTM: Processing by furin produces a secreted form.

DISBASE: Defects in EDI are the cause of ectodermal dysplasia, anhidrotic (EDA) [MIM:305100] also known as X-linked hypohidrotic ectodermal dysplasia (XLHED). EDA is a disease characterized by sparse hair (atrichosis or hypotrichosis), abnormal or missing teeth and the inability to sweat due to the absence of sweat glands. EDA is the most common form of over 150 clinically distinct ectodermal dysplasias. This disease was already described
                                                                                                                                                                                                                                                                                                                         Isold=Q92838-8; Sequence=VSP 006460, VSP 006461;
TISSUE SPECIFICITY: Not abundant; expressed in specific cell types
of ectodermal (but not mesodermal) origin of keratinocytes, hair
                                                                                                                                                                                                                                                                                                                                                                                                      follicles, sweat glands. Also in adult heart, liver, muscle, pancreas, prostate, fetal liver, uterus, small intestine and umbilical chord.

                                                                                                             "Ectodysplasin, a protein required for epithelial morphogenesis, is a novel TNF homologue and promotes cell-matrix adhesion."; Mech. Dev. 88:133-146 (1999).

-!- FUNCTION: Involved in epithelial-mesenchymal signaling during morphogenesis of ectodermal organs. Isoform TRA binds only to the receptor EDAR, while isoform TA-A2 binds exclusively to the receptor XEDAR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              -!- PTM: N-glycosylated (By similarity).
-!- PTM: N-glycosylated (By similarity).
-!- PTM: Processing by furin produces a secreted form (By similarity)
-!- DISEARE: Defects in ED1 are the cause of the tabby phenotype in mice (the equivalent of anhidrotic ectodermal dysplasia in humans). The disease is characterized by sparse hair (atrichosis or hypotrichosis), abnormal or missing teeth and the inability to sweat due to the absence of sweat glands.

-!- SUBCELLULAR LOCATION: Nuclear (Potential).
-!- TISSUE SPECIFICITY: Expressed in Kidney; more specifically renal juxtaglomerular (GG) cells.
-!- SIMILARITY: Contains 2 RANBP2-type zinc fingers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        . 66
